Introduction

This report explains the design and development of my online portfolio for this module. The main goal of the assessment is to create a personal portfolio website that has all information about me and the LaTeX CV in clear and clean way. Nowadays many companies and employers use online portfolios to evaluate interviewers before coming to the interview. The portfolio allows to show the skills, projects, certificates, etc. And for this reason doing or creating a portfolio is so important for students that study computer related stuff. For this project I created portfolio website using HTML and for my CV and report I used LaTeX. As also Github pages was used to host and publish my portfolio and beside that I did a Github repository that contains all the files related to the project the website code, images and my LaTeX code for the report and the CV. The project also gave me so much skills and experience in lots of branches such as Github, web development and LaTeX documentation as this report shows the technologies used, my repository and CV.

Portfolio Overview

The portfolio website was created to provide simple introduction about my self. As it also contains my education, skills and contact details.

Portfolio Website Link: <https://tonygamiel997-dev.github.io/Tony-Armal.github.io/>

The home page introduces me shortly as software Engineering Student and explains my interests in one or two words also wanted the visitor to understand quick who am I and what am I studying. The about me section has short information of the description of my background and interests. Another important section is the skills section as this area shows my skills that I gained or I have as also I am still developing my skills. The education section includes current statuses about me and my high school also. The contact section allows the visitors to reach or contact me through many ways stated there in the website as number, email, github, my CV and linked in. These options make it easier to contact or reach me. Overall the website is designed as a simple way to scroll and navigate. As also the main goal is to make sure that the visitors can find what they need easily without searching a lot and saving time for them.

Github Repository

The portfolio project is stored in the github repository and also Github is one of the biggest platforms that are used in the software development and project management (GitHub, 2025). It allows developers to store, organize and share the project files.

GitHub Repository: <https://github.com/TonyGamiel997-dev/Tony-Armal.github.io>

The repository contains all the files related to the project and the report too. Includes the code, images, files, LaTeX CV and Report. The repository is organised in a way that allows the users or developers understand the structure of the project. One also of the important files is the README file that contains brief explanation of the project and the contents as also it is considered as good practice because it helps visitors the repository before opening it or exploring the files. GitHub also allows the developers track changes or change and edit the work (GitHub, 2025). However this project is small but using or learning how to use GitHub is so important in the software development.

Job Market

One of the main reasons also for creating this portfolio was the relevance to the job market and future software engineering careers. As many companies now look at portfolios and repositories when evaluating candidates. My portfolio includes links to my GitHub and linked in profile as there is a downloadable button for my CV also. LinkedIn is used for job opportunities (LinkedIn, 2025).

Tools used

Several tools and technologies were used to develop this portfolio.

- HTML (to create the website)
- GitHub (was used to host my page and publish my page online as it also contains my repository and files for the project and the report)
- LaTeX (was used to create my Cv and this report)

The mix of these technologies allowed me to make a portfolio, CV and report while also at the same time I was gaining practical experience.

Improvements

There are lots of improvements I would like to do or add in the future and the most important is adding more project that I will develop or create along my studies such as from assignments or personal projects I will include all. I will also add new programming languages and technologies that I will learn along my bachelor. Another improvement detailed project descriptions as this will provide visitors with better understanding to my technical abilities. I also plan to include certificates maybe internships and achievements and other experiences as I progress in my academic career. By updating my website everytime I will become a stronger developer and represent my skills and growth as Software Engineering Student.

Conclusion

This project gave me good experience in web development, GitHub and LaTeX also. The website portfolio presented most of my information in clear way as also through the use of HTML, GitHub pages and LaTeX as mentioned above in the previous parts. Overall the project helped me to improve my skills work more with codes and learn more about programming.
